FDBConvert Description: Today I would like to present you a new release of my AIM - Activation Manager! AIM has simple interface, but it's extremely flexible. That's the whole power of AIM. Key features: · You can design your own AIM buttons, menus, and dialogs · AIM has user-friendly dialogs with plenty of messages from AIM and you can use all messages and support for all dialects · AIM has ability to check online user status. What is much more important - AIM can connect to the server and know about your user status! · AIM contains support for multiple languages.Q: Store member function pointer to member function in smart pointer? I would like to use a smart pointer for a member function, which pointer is supposed to point to a function which takes a reference to a class. I do not want to have a reference to the class in my smart pointer itself. I came up with a solution, which is to use a function pointer pointing to the member function, and then a function pointer inside the smart pointer which invokes that function. However, this does not feel right. It feels like I am using a hack to solve a problem. What is the best way to do this? A: You're using a pointer to function as a pointer to member function? XAMPPQ: C# Anyways to limit number of columns used in a generic datagridview? I'm building a generic application in c# using the MVVM pattern. I have a datagridview which i create with the user's inputs and a combobox which act as a search criteria. It works fine, but i now want to display the result in a nicer layout. My first thought would have been to split the datagridview in two, like so: This would obviously mean that i need to know the number of groups available in the viewmodel at design time, but that's not very important, since i can adjust it in
